Publication No. US20030104410A1
GENERAL INFORMATION:
HUMAN Michael
TITLE OF INVERTION: Human Microarray
FILE PEFRENCE: 3118.1
FILE PEFRENCE: 3118.1
CURRENT APPLICATION NUMBER: US/10/098,263B
CURRENT PILING DATE: 2003-01-08
FRIOR FILING DATE: 2001-03-16
NUMBER OF SEQ ID NOS: 131066
SOFTWARE: Microarray Probe Sequence Listing Generator V 1.1
LENGTH: 25

                                                                                                                                                                                                                        PCI-USO3-0408B-340, Application PC/TUS0304088

Sequence 540, Application PC/TUS0304088

GENERAL INPORMATION:
APPLICANT: Ribozyme Pharmaceuticals, Inc.
APPLICANT: Beigelman, Leonid
TITLE OF INVENTION: RNA Interference Mediated Inhibition of Telomerase Gene
TITLE OF INVENTION: RNA Interference Mediated Inhibition of Telomerase Gene
TITLE OF INVENTION: RNA Interference Mediated Inhibition of Telomerase Gene
TITLE OF INVENTION: Expression Using Short Interfering RNA (siNA)
FILE REFERENCE: 02-708-A (400/080)

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection

polynucleotide(s) anti:sense to human telomerase - used for

New polynucleotide(s) anti:sense to human telomerase - used for detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection

Claim 11; Page 65; 80pp; English.

Sequences shown in AAV41169 to AAV41181 represent antisense
oligonucleotides to the RNA component of human telomerase (hTR). These
antisense oligonucleotides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR. but that does not
hybridise to a sequence within the template region of hTR. These
component of human telomerase in a sample. This is useful for diagnosing
component of human telomerase in a sample. This is useful for diagnosing
component of human telomerase in a sample. This is useful for diagnosing
concertides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the
half-life of the telomerase RNA component transcript, inhibiting assembly
of the RNA component into the telomerase activity, in both cultured cells and in
be used for inhibiting telomerase activity in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
menunosuppression, and for selectively down-regulating specific branches
immunosuppression, and for selectively down-regulating specific branches
in the immune system. e.g. a specific subset of T-cells, in the contraction of the anti-inflammatory therapies or for treating infections by, e.g. yeast, parasites or fungi

```
Sequences shown in AAV41169 to AAV41181 represent antisense
oligonucleotides to the RNA component of human telomerase (hTR). These
antisense oligonucleotides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR, but that does not
thybridise to a sequence within the template region of hTR. These
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitory
colonicated scan inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the
coligonucleotides can into the telomerase holoenzyme, or inhibiting the
colonwers activity of telomerase. These antisense oligonucleotides can
colonwers activity of telomerase activity in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
colls in vivo. They can be used in therapeutics for treating or
immunosuppression, and for selectively down-regulating specific branches
con the immune system, e.g. a specific subset of T-cells, in
colls immune system, e.g. a specific subset of T-cells.

New polynucleotide(s) anti:sense to human telomerase - used for

```
oligonucleotides to the RNA component of human telomerase (hTR). These antisense oligonucleotides specifically hybridise to a nucleotide sequence within an accessable region of the hTR, but that does not hybridise to a sequence within the template region of hTR. These oligonucleotides may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory interfering with transcription of the RNA component, decreasing the cancerfering with transcription of the kNA component transcript, inhibiting the polymerase activity in both cultured cells and in the used for inhibiting telomerase activity in both cultured cells and in cells in vivo. They can be used in therapeutics for treating or immunosuppression, and for selectively down-regulating specific branches of the immune system, e.g. a specific subset of T-cells, in

senescence. Recombinant expression vectors comprising a recombinant polymucleotide corresponding to a polymucleotide in a human GCG gene, are useful for altering senescent gene expression. The vectors and host cells comprising the vectors are useful for identifying agents that prevent or modulate senescent gene expression. The polymucleotides are useful for producing the protein, pGCG and nucleic acid derivatives. The proteins encoded are useful for raising antibodies specific for pGCG, which are useful for raising antibodies specific for pGCG, which are useful for isolating pGCG, and for detecting cells comprising pGCG in complex cell mixtures. The characterization of the polymucleotides enable the identification of therapeutic agents that identify and distinguish between young and senescent cells. This enables treatment of aging diseases induced or exacerbated by cellular senescence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to three polymorphic variants of a rat transcriptional regulatory factor Elf-1 (AAB03190-B03192) and nucleic acids encoding them (AAA61645-A61647). The invention also encompasses the use of Elf-1 for regulating the transcription of a gene in an expression vector. The cDNA encoding rat Elf-1 variant #1 (AAA61645) ODNA, and the rat Elf-1 variant #2 and 3# cDNAs (AAA61646-A61647) were subsequently isolated . The Elf-1 cDNA and protein sequences are potentially useful for the prevention and treatment of immunological and allergic diseases mediated by Elf-1. Sequences AAA61648-A61649 represent mouse Elf-1 PCR primers used in an exemplification of the invention to isolate rat Elf-1 variant #1 cDNA.
                                                                                                                                                                                                                                                                                                                                     Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A transcription regulating factor Elf-1 cDNA and its polymorphism
                                                                                                                                                                                                                                                                                                                                     ..

This method involves administering a soluble type-II IL-1 receptor protein in an amount effective to bind to IL-1 and prevent its binding to cell-surface IL-1 receptors. The process can be used for treating alloantigen-induced rejection of transplanted tissues or organs, graft-versus-host disease and autoimmune dysfunction dependent upon the activation of T cells against self antigens, selected from rheumatoid arthritis, diabetes mellitus or multiple sclerosis.
                                                                                                                                                                                                                                                                                  regulation, soluble, cell surface receptor; treatment; alloantigen; tissue; organ; rejection; transplant; graft-versus-host disease; human; autoimmune dysfunction; T-cell activation; self antigen; primer; rheumatoid arthritis; diabetes mellitus; multiple sclerosis; ss.

Arraying genome clones WPI; 2002-144136/19.

```
The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in can miliwell plates; (b) a primer designed based on the chromosome marker call plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant camplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified corresponding the above primer; (g) signals can lateral directions; (f) the mixed clones are cultured and the call tracetions; (f) the mixed clones are cultured and the creatitate are amplified products; (h) the clones in the multiwell contains are applified broducts; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed contains are present the contain the present of plates are present the contain the present of plates are present the contain the plates are applified by mind ABL42937 to ABL4532 represent processing the present processing the present plates are plates and plates and arrayed. The processing plates are plates and plates and plates are plates and plates and plates and plates and plates are plates and

This invention describes Secale cereale microsatellite markers based on hypervariable genomic segments of Secale cereale and plants of the tribicate and Poeae. The microsatellite markers comprise a simple sequence repeat (SSR) marker as sequence tag site (STS), defined by two specific S. cereale defined primers, of mean length 18-26 bases and flanking the microsatellite sequence (MSS). Such markers are useful for genetic analysis of rye, triticale and other species of the tribes Triticeae and Poeae, e.g. for DNA fingerprinting; identification of varieties; detecting self or cross fertilization; studying similarity and enaltedness; characterization of cytological lines, or special mapping sort of gene mapping. Particularly, they are useful for genetic mapping and marking of mono- or poly-genic traits, selection and evaluation of varietal purity or checking culture stages (particularly in hybrid culture methods), purity of propagative materials, success of culture methods), purity of propagative materials, success of hybrids. AMX36902-X36965 represent PCR primers used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Intercellular adhesion molecule 6; ICAM-6; drug screening; therapy; intercellular adhesion; inflammatory process; PCR primer; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel microsatellite markers (MSM), based on the hypervariable genomic regions of rye (Secale cereale) and of plants from the tribes Triticeae and Poeae. MSW, which are new genetic markers for rye and closely related species, are used for genetic analysis and in breeding programs. Typical applications are in DNA fingerprinting; identification of varieties; detection of self and cross pollination; characterization of cytoplasmic lines, and genetic mapping (of mono- or poly-genic traits). MSW show a higher degree of polymorphism than known markers (both within and between different rye varieties and lines); can be detected by polymerase chain reaction, so that even very small samples may be analyzed, and generate many alleles per marker locus. AAZ2387-Z23886 represent the microsatellite marker PCR primers

burnary AAF80328-30 were used to amplify cDNA encoding a human G-protein coupled receptor designated ISS4. IGS4 exists in two polymorphic forms, IGS4A and IGS4B. IGS4 receptors and IGS4 coolymucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases. These diseases include peripheral nervous system disorders (e.g. schizophrania, episodic paroxysmal anxiety, phobia, Parkinson's disease, migraine, epilepsy, bulimia or stroke), cardiovascular diseases or motility disorders), cheart failure, angina pectoris, myocardial infanction or hypertension), dyslipidemias, bowel disease or motility disorders), osteoporosis, inflammations, infections (e.g. bacterial, fungal, protozoan or viral), pain, cancers, immune disorders, allergies, spiss or syncological disorders of the nervous system, including the effective with regard to disorders of the nervous system, including or system, cardiovascular system, septeme, septemen, septemen, septemen, septemen, septemen, septemen, septemen, septemen, septemen, or immunological disease. The IGS4 polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AA173060 to AA179867 represent isolated human polymorphic polynucleotide agequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM5329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gastrointestinal disorder; inflammatory bowel disease; osteoporosis; inflammation; infection; pain; cancer; immune disorder; allergy; sepsis; gynecological disorder; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New G-protein coupled receptors and the polynucleotides encoding them, useful for preventing, ameliorating or correcting nervous system disorders, cardiovascular diseases, dyslipidemias, inflammations, pain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                              involving intercellular adhesion, e.g. in inflammatory processes. The products can also be used for detection, diagnosis and the production of transgenic animals. PCR primers AAX36170-73 were used in the course of the invention.
                                                                                                                                                                                                                                     The specification describes an intercellular adhesion molecule (ICAM)-6 polypeptide. The ICAM-6 polypeptides and polynucleotides can be used for drug screening and developing products for therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PCR primer for cDNA encoding the G-protein coupled receptor IGS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                              New isolated intercellular adhesion molecule-6 used for, e.g. diagnosis of inflammatory processes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 24;

them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides.

For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acide in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; single nucleotide polymorphism; SNP; genome; gene therapy;

This invention describes a novel factor VIII polypeptide (I) with factor VIII: Cactivity which has a modification in at least one of the A3, C1 and/or C2 domains of the light chain that modifies binding affinity to low density lipoprotein receptor-related protein (LRP). Independent claims are also included for the following: (I) DNA (II) that encodes (I); (2) an expression vector containing (II); (3) transformed cells and their descendants containing (II); (4) recombinant production of (I) by culturing cells of (C); and (5) pharmaceutical composition containing a factor VIII molecule (Ia) with factor VIII:C activity plus an LRP actor VIII from the blood. (I), optionally formulated with clarance of factor VIII from the blood. (I), optionally formulated with an antagonist of LRP, is used for treatment of coagulation disorders, an antagonist of LRP, is used for treatment of coagulation disorders, an antagonist of LRP, is used for treatment of coagulation disorders, an antagonist coafficially hemophilia A. It may also be used to treat subjects with disorders of the thrombotic or fibrinolytic systems, e.g. before, during or after surgery. Nucleic acid that encodes (I) can be used
complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (1) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Factor VIII; light chain; LRP; gene therapy; antihemophilic; blood; low density lipoprotein receptor-ralated protein; coagulation disorder; thrombotic system; fibrinolytic system; primer; ss.

AAM53114 to AAM53129 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polymeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient, s genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single nucleotide polymorphisms and cytosine methylation status

Claim 1; SEQ ID 341035; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC10010-ABE29989, ABF00010-ABF99989, ABF00010-ABF99989 and NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Sequence 5, Application US/08770564A
GENERAL INFORMATION:
APPLICANT: Realey, James T.
APPLICANT: Pruzan, Roctt L.
TITLE OF INVENTION: Inhibitory Polynucleotides Directed
TITLE OF INVENTION: Against the RNA Component of Telomerase
NUMBER OF SEQUENCES: 15
CORRESPONDENCE ADDRESS:
ADDRESSE: TOWNSEND and TOWNSEND and CREW LLP
STREET: TOW EMbarcadero Center, 8th Floor
CITY: San Francisco
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match 100.0%; Score 30; DB 11; Length 30; Best Local Similarity 100.0%; Pred.
